

MEDITECH TRAVERSE EXCHANGE CANADA

UNITING COMMUNITIES THROUGH INTEROPERABILITY

Break down data silos and offer your providers a more comprehensive patient record with Traverse Exchange Canada. This new, first-of-its-kind cloud-based interoperability solution enables the free flow of health information from multiple participating organizations, so you can see the complete patient story.

What Makes **Traverse Exchange Canada** Unique

- ✓ Provides clinicians with a complete picture of their patients' records directly within the MEDITECH EHR — regardless of where care was provided.
- ✓ Sends data to MEDITECH's EHR as well as other EHRs that comply with interoperability standards through a single connection.
- ✓ Retrieves data across jurisdictional or federal systems from a variety of sources.
- ✓ Supports the viewing or consumption of discrete data within the EHR.

Providers

- ✓ Deliver safer care by having access to the patient's whole record.
- ✓ Receive data automatically without searching — thereby reducing their burden.
- ✓ Have immediate access to medications, allergies, immunizations, problems, and lab results at their fingertips.

Patients

- ✓ Move freely between care facilities, knowing their records will follow — no repeating their health information at each visit.
- ✓ Feel confident knowing their providers have the up-to-date information they need to make sound decisions.

Organization

- ✓ Moves towards true, seamless data exchange.
- ✓ Reduces IT burden with a one-to-many approach to interoperability.
- ✓ Protects privacy by securely connecting to outside sources to obtain patient information (using a federated, query-based approach).

Putting the right information in the hands of the people who need it is what interoperability is all about. With Traverse Exchange Canada, we will be able to access external records from acute care, primary care, long term care, and other settings to create a more intelligent patient picture that is relevant to the care journey and pertinent to the moment. This kind of intelligent interoperability will improve patient outcomes and lays the foundation for delivering personalized care to our community.
